```

Total: 221 bytes???

Correct or incorrect?

Memory layout of variables

- Most modern ISAs require that data be aligned.
- What do we mean by alignment in this context?
 - An N-byte variable Arasist intractiant Pricaje date Essantia Liberth (A % N) == 0
- "Golden" rule Address of a variable is aligned based on the size of https://powcoder.com
 - char is byte aligned (any address is fine) owcoder
 - short is half-word (H) aligned (LSBit of address must be 0)
 - int is word aligned (W) (2 LSBit's of addr must be 0)
- This greatly simplifies hardware needed for loads and stores
 - Otherwise, multiple memory accesses need to be used to access one piece of data

 Each field is laid out in the order it is declared using the Golden Rule for alignment

Assignment Project Exam Help

- Identify largest (primiting) fig/powcoder.com
 - Starting address of overall struct is aligned based on the largest field
 Size of overall struct is a multiple of the largest field

 - Reason for this is so we can have an array of structs
 - Guarantees that each instance of struct is aligned the same way

C-code		
<pre>struct { char w; int x[3] char y; short z; } s;</pre>		

Assignment Project Exam Help

https://powcoder.com

Add WeChat powcoder

Datatype	size (bytes)
short	2
char	1
int	4
double	8

```
C-code

struct {
  char w;
  int x[3]
  char y;
  short z;
} s;
```

```
Start address 1666
w: Assignment Project Exam Help. 3
  Padding: 1017 7 1017
7:28 1018 7 1019
                              13
         1000 7 1019 1.20 B
```

Datatype	size (bytes)
short	2
char	1
int	4
double	8

C-code struct { char w; int x[3]char y; short z;

} s;

Largest field is 4 bytes (int), therefore:

- Struct size will be multiple of 4 struct size will be s since a word is 4 bytes

https://powcoder.com

Assume struct starts at address 1000, what is the data And the Chadt powcoder

Datatype	size (bytes)
short	2
char	1
int	4
double	8

Datatype size (bytes) short 2 char 1 int 4 double 8

char w; int x[3] char y; short z; } s;

Largest field is 4 bytes (int), therefore: since a word is 4 bytes https://powcoder.com Assume struct starts at address 1000, what is the data and the that powcoder start: 1000 char w -> 1000// padding 1001-1003 -> 1004-1007 -> 1008-1011 $x[2] \rightarrow 1012-1015$ char y -> 1016 // padding 1017 end: 1019 short z -> 1018-1019 Total size = 20 bytes

Why padding?
"Golden" rule –
Address of a
variable is
aligned based
on the size of
the variable

Problem: Calculate the total amount of memory needed for the declarations.

address	8

Data Layout – Why?

- Does gcc (or another compiler) reorder variables in memory to avoid padding?
- No, a compiler will not optimize data layout to remove padding.
- C99 standard prohibits this://powcoder.com
 - Memory is laid out in order of declaration for structs.
- gcc has implemented an option for this, then later removed it
- The programmer (i.e., you) are expected to manage data layout of variables for your program and structs.
- For a start: order fields in struct by datatype size, smallest first

Logistics

L5_2 Assignment Project Exam Help Control Assignment Project Exam Help Control

EECS 370 – Introduction to Computer Organization – Fall 2020 Add We Chat powcoder

Learning Objectives

- Recognize the set of branching instructions for ARM ISA and be able to describe the operations and operands for instructions
 - LEGv8 subset Assignment Project Exam Help
- Understand mapping of complex C-code branching instructions into corresponding assembly code instructions

Add WeChat powcoder

ARM/LEGv8 Sequencing Instructions

- Branching
- PC+4B
- Sequencing instructions change the flow of instructions that are executed
 - This is achieved by modifying the program counter (PC)
- Unconditional branchessigtheents Project the Name Help they ALWAYS change the PC and thus "jump" to another instruction out of the usual sequence https://powcoder.com
- Conditional branches
 Add WeChat powcoder
 - if (condition_test) goto target_address
 - condition_test examines the four flags from the processor status word (SPSR)
 - target_address is the 19-bit signed word displacement from current PC

LEGv8 Conditional Instructions

- Two varieties of conditional branches
 - 1. One type compares a register to see if it is equal to zero.
 - 2. Another type chacksighencendi Pronjectes xatnin Ithelp tatus register.

	compare and branch		if (X1 == 0) go to	Equal 0 test; PC-relative branch
	on equal 0	https://	poweoder.com	
Conditional	compare and branch	CBNZ X1, 25	if (X1 != 0) go to	Not equal 0 test; PC-relative
branch	on not equal 0	Add W	eChatloowcoder	branch
`	branch conditionally			Test condition codes; if true, branch
			PC + 100	

- Let us look at the first type: CBZ and CBNZ
 - CBZ Conditional Branch if Zero
 - CBNZ Conditional Branch if Not Zero

- CBZ/CBNZ: test a register against zero and branch to a PC relative address
 - The relative addressisignabing projected and lead purpose of instructions. Recall instructions are 32 bits of 4 bytes https://powcoder.com

	ARM LEGv8	Add WeChat powesgription
×	CBNZ X3, foo CBNZ X3, <u>25</u>	 if X3 does not equal 0, then branch to label foo 25 is an offset from the PC of the current instruction (CBNZ)

LEGv8 Compare and Branch Instructions

- CBZ/CBNZ: test a register against zero and branch to a PC relative address
 - The relative addressisignabinsignojeint gramthed pmber of instructions. Recall instructions are 32 bits of 4 bytes

https://powcoder.com

			L	
	compare and branch	CBZ X1, 25	if (X1 == 0) go to	Equal 0 test; PC-relative branch
	on equal 0	Add V	WeChat powcoder	
Conditional	compare and branch	CBNZ X1, 25	if (X1 != 0) go to	Not equal 0 test; PC-relative
branch	on not equal 0		PC + 100	branch
	branch conditionally	B.cond 25	if (condition true) go to	Test condition codes; if true, branch
			PC + 100	

Why does 25 in the table result in PC + 100?

Offset is # of instructions (words)

Problem: Calculate the numerical offset for the CBNZ instruction.

```
ARM LEGv8 Assignment Project Exam Help

loop: ADDI X3, X3, #ttps://powcoder.com
SUBI X4, X4, #1
ADD X5, X3, **Atld WeChat powcoder
CBNZ X5, loop

#-3
```

Problem: Calculate the numerical offset for the CBNZ instruction.

Assignment Project Exam Help Offset field: 19-bit, signed ARM LEGV8

loop:

SUBI X4, X4, #1

CBNZ X5, loop

X5, X3, X4dd WeChat powcoder

The assembler will calculate the offset

If any instructions are added or removed while writing code, using a label saves from recalculating the offset

How is the branch target address calculated?

ARM LEGv8

CBNZ X5, #-3

FLAGS: BINARY, SET OR UNSET

ARM LEGv8	Description
ADDS X1, X2, X3	Causes the 4 flag bits to be set accordingly as the outcome is negative, zero, overflows, or generates a carry bit

LEGv8 Condition Codes

- In LEGv8 only ADDS / SUBS / ADDIS / SUBIS / CMP / CMPI set the condition codes FLAGs or condition codes in PSR—the program status register
- Four primary condition soignmental Project Exam Help
 - N set if the result is negative/i.e. bit 63 is non-zero)
 - Z set if the result is zero (i.e., all 64 bits are zero)
 - C set if last addition/selected and the complete of bit 63
 - V set if the last addition/subtraction produced an overflow (e.g., two negative numbers added together produce a positive result)
- Do not worry about the C and V bits *per se*. They are important but are tricky to understand.
 - Instead we will just be using branches based on these results for signed numbers which is a lot easier to deal with.

Conditional Branches

- CMP instruction lets you compare two registers, set NZVC flags
 - Could also use ADDS etc.

Assignment Project Exam Help

• B. condition lets you branch based on the flags set by CMP (ADDS, etc.)

ARM LEGv8	Add WeChat powestription
CMP X1, X2	Branches to label1 if value in register X1 greater than value in
B.GT label1	register X2

What is the set of conditions for B.condition?

LEGv8 Conditional Instructions

				-	-	

Branching Far Away

- The underlying philosophy of ISA design and microachitecture in general is to make the common case fast
- In the case of branches, you are commonly going to branch to other instructions nearby.
 - In ARMv8, the encoding for the displacement of conditional branches is 19 bits.
 - Having a displacement of 1914 Suspaly Godgr. com
- BUT what if we need jump to altarget (Label) that we cannot get to with a 19-bit displacement from the current PC?

 CBZ X15, FarLabel
- The assembler is smart enough to replace that with
- The simple branch instruction (B) has a 26-bit offset which spans about 64 million instructions!

CBNZ X15, L1
B FarLabel
L1:

Unconditional Branching Instructions

	branch	В	2500	go to PC + 10000	Branch to target address; PC-relative
Unconditional branch	branch to register	BR	X30	go to X30	For switch, procedure return
	branch with link	BL Ass	²⁵⁰⁰ ignment	Project Exam Help	

- There are three types of uncontaining home deinchente Gv8 ISA.
 - The first (B) is the PC relative branch with the 26-bit offset from the last slide.
 - The second (BR) jumps to the application to the second (BR) jumps to
 - The third (BL) is like our PC relative branch but it does something else.
 - It sets X30 (always) to be the current PC+4 before it branches.
 - Why?
 - Function calls return to next instruction

```
X1→i
X2→sum
X4→#10
```

X5→a[i]

X6→i*8

a is array of long long integers (64 bits, 8 bytes) Start of a at address 100, sum starts at address 96

C-code instructions

```
Assignment Project Exam Help
```

```
for (i=0; i <htps://powcoder.com
if (a[i] >= 0) tps://powcoder.com

sum += a[i];
}
Add WeChat powcoder
}
```

Problem: Convert the C code to LEGv8 assembly (assume no registers initialized)

Register to variable mapping

X1→i

X2→sum

X4→#10

X5→a[i]

X6→i*8

a is array of long long integers (64 bits, 8 bytes) Start of a at address 100, sum starts at address 96

C-code instructions sum = 0;for (i=0; sum += a[i];
